Company from Coimbra creates innovation to detect security flaws

DOGNÆDIS, 'start-up' specialist in information security formed by reserachers from the College of Science and Technology of the University of Coimbra (FCTUC), created an innovative technology that detects and corrects, in real time, security problems on 'software'.

Entitled 'CodeV', the technology, already available, is an “intelligent inspector-professor that detects security problems, fires alerts, produces reports and gives instructions to correct problems”.
